

Pneumatic actuator

Introduction

Proven advantage

The COMPACT actuator is a quarter-turn rack & pinion pneumatic actuator that doubles the torque of standard pneumatic actuators. The superior performance is achieved by Habonim's patented four piston design, which generates torque around a centrally located piston. This translates into double the power for the same size actuator or half the size for the same amount of power.

Space saving, fast acting

The COMPACT has four small cylinders, each located on one of the four sides of the cube.

The smaller pinion and shorter travel distance of the pistons in the COMPACT require less air pressure than a larger double-piston actuator to produce the same torque output. The end result is faster response times for emergency shutdown, lower air pressure for operation and reduced maintenance.

Technical summary

Pressure range	20-120 PSI (1.5 - 8 bar) for Double Acting (DA) actuators 30-120 PSI (2- 8 bar) for Spring Return (SR) actuators		
Size range	C15, C20, C25, C30, C30M, C35, C35M, C45, C45M, C60, C60M, C75, C75M		
Operating temperature	NBR	-20 °C to 80 °C	(-4 °F to 176 °F)
	Viton	-20 °C to 120 °C	(-4 °F to 250 °F)
	EPDM	-40 °C to 80 °C	(-40 °F to 176 °F)
	NBR FX428	-53 °C to 100 °C	(-63 °F to 213 °F)
Compressed gas	Air, Nitrogen, CO ₂ , Natural gas (sweet)		

Standards of compliance

Factory certification	ISO 9001-2008	Quality management system
Actuator design	ISO 5211	Industrial valves - part-turn actuator attachments
	VDI/VDE 3845 (NAMUR)	Industrial process control - pneumatic control valves - Interfaces of valves and auxiliary equipment
Certifications	ATEX 94/9/EC	equipment and protective systems intended for use in potentially explosive atmospheres
	DNV	Rules of classification of ships 'Det Norske Veritas' offshore standards
	IEC 61508-2 SIL 2/3	Safety integrity level - functional safety of electrical/ electronic/programmable electronic safety-related systems (optional for actuated unit only)
Documentation	EN 10204 2.2 / 3.1 / 3.2	Metallic materials - types of inspection documents

Main pneumatic actuator features

Balanced forces

The cube-shaped configuration positions the pistons in a way that allows each piston to develop thrust along its own axis with zero side load. This efficient design eliminates the use of guide rods and thrust bearings. The result is less stress on the seals than off-axis piston thrust, which is caused by the piston side loading that is inherent in the geometry of traditional actuator configurations.

Less wear

The COMPACT's unique 4-piston design achieves a more uniform load distribution than standard single- or double-piston actuators, therefore greatly reducing the wear on gears at the points of contact between rack and pinion. The force-balanced, shorter-stroke piston prevents uneven wear of O-rings, gears and pistons. This design eliminates the need for bearings and guiding rods and reduces the number of soft parts, thereby resulting in longer maintenance schedules and lower cost of repair kits. The surface of the four cylinders is hardened by an anodizing treatment, which protects their high surface finish.

Superior corrosion resistance

The body and covers are anodized internally and externally to protect against corrosive atmospheres tested to more than 336 hours of life in a salt spray bath. An external epoxy base layer and a second layer of polyurethane paint provide additional protection against aggressive environments. Optional: Electroless-Nickel (EN) coating of body, covers and pistons.

Less air consumption

Fast action is one of the most attractive features of the COMPACT 4-piston actuator. The distinctive four-piston design allows for a smaller diameter actuator pinion that significantly shortens piston travel and response time.

Fast action

Fast action is one of the most attractive features offered by the COMPACT 4-piston actuator. The unique four-piston design allows for a smaller diameter actuator pinion that significantly shortens piston travel, resulting in a shorter response time.

Spring return and double acting configurations

The COMPACT can be configured for either spring return or double-action operation. In both cases the air supply to drive the pistons flows into Port A of the NAMUR cover. Port A is connected to the center chamber, and Port B is connected to the four outside chambers.

Spring return (fail-safe)

Pressure entering Port A to open:
Center chamber is pressurized and pistons
move outward
Springs are compressed
Pinion rotates counterclockwise

Pressure exiting Port A to close:
Air released from center chamber
Springs drive pistons inward
Pinion rotates clockwise

Double action (increased torque)

Pressure entering Port A to open:
Center chamber is pressurized
Pistons move outward
Pinion rotates counterclockwise

Pressure entering Port B to close:
Outside chambers are pressurized
Pistons move inward
Pinion rotates clockwise

Main pneumatic actuator components

Pinion

The pinion has a double-square female drive on its bottom plane that complies with ISO 5211 standard. The top plane has the NAMUR slot for attachment to switches or positioners. There is a machined flat below the NAMUR interface to enable manual operation of the actuator with a wrench. The pinion is made from carbon steel with Electroless-Nickel (EN) plating that results in a hard-wearing surface with added protection against corrosive environments.

Limit stop

The pinion and stop rotation can be adjusted by four large-diameter, diametrically-opposed adjustable set-screws that are threaded into the actuator body. Each opposing pair of screws exerts simultaneous and equal force on opposite sides of the stop when the rotation limit is reached, thus preventing the generation of off-center forces. The stop screws allow for $\pm 5^\circ$ rotation adjustment in both directions of travel. Larger span can be achieved with a longer set of stop screws. This feature is built into the actuator stop mechanism and eliminates the need for additional plates and screws. The stop material is stainless steel for better wear and corrosion resistance.

Indicator & puck

A highly visible indicator with flow direction arrows is snapped on to the pinion, to provide easy identification of the valve position. These indicator arrows allow true positioning of any type of valve porting. The modular design makes it easy to change the indicator to match various flow pattern.

Safety features

The COMPACT's built-in safety features ensure secure and safe operation. Assembly and dismantling of the actuator are simple tasks. Long cover-bolts for spring return actuators relieve the spring load before they disengage from their threads. Before the pistons can be removed, the stop screw must be released and the pinion removed thus ensuring that any trapped and potentially hazardous pressure in the body will escape.

Partially closed

Partially open

Nested springs

The COMPACT can be used with up to three different spring sizes for the spring that, in each of the four cylinders, is nested between the cover and the piston and aligned by a centering ring. Each spring is wound in the opposite direction to its neighbor to avoid entanglement. All the springs act at the piston center axis so that no side load will occur if one spring fails to operate. By virtue of the four-cylinder design, there are many more spring combination possibilities than with double piston actuators, providing superior solutions for any air supply pressure required. Special painting of the springs provides higher corrosion resistance to the environment, resulting in more than 250 hours of life in a salt spray bath.

Spring cartridge

Using a modified spring set in a cartridge improves the torque characteristics of the COMPACT actuator. A spring cartridge is available only in the C30M, C35M, C45M, C60M and C75M actuators. Modifications include deeper covers to allow sufficient volume for the spring cartridge, thereby increasing the overall dimensions of the actuator. The spring cartridge is comprised of a shaped tube in which the extended springs have been preloaded and are held safely in place by two rigid discs. Changing a spring set configuration in this design requires changing the complete cartridge.

Sizing a spring return actuator requires that the torque output at the start and end of both the spring and air drive strokes is greater than the valve torque at that position.

Emergency Shut-Down system (ESD)

Short response time

A short response time is essential for valves operating in Emergency Shut Down (ESD) systems such as in refineries, power stations, mining and other applications where Safety Integrity Level (SIL) loops are a mandatory requirement.

The values in the table below indicate the closing time (seconds) of an unloaded actuator and a loaded actuator with torque values simulating real-life situations. The stroke time measures the actual movement of the actuator without a solenoid or any other accessory delay.

COMPACT actuator stroking time (sec.)

1/4" NAMUR solenoid valve

COMPACT Actuator for emergency Shut-down (ESD) systems		1/4" NAMUR solenoid valve Cv = 0.9, 80 Psi instrument air pressure feed by 6 mm I.D. pipe			1/4" Non- NAMUR solenoid valve, Cv = 1, 80 Psi Instrument air pressure feed by 6 mm I.D. pipe + 1/4" quick exhaust

NAMUR & ISO interface

An extensive range of accessories such as solenoids, positioners and limit switches are available for direct mounting to the COMPACT actuator. Any accessory whose connections comply with ISO 5211 and VDI/VDE 3845 (NAMUR) mounting can be connected to the actuator.

NAMUR VDI/VDE 3845

This standard provides for a range of accessories such as limit switches, pucks, indicators and positioners with a VDI/VDE interface so that they can be easily mounted onto the actuator top face.

NAMUR solenoid mounting

One of the four available actuator covers incorporates a pad for solenoid mounting according to the NAMUR international standard. Any solenoid that conforms to the NAMUR interface can be directly mounted to the actuators, thus simplifying the installation of solenoids and eliminating additional piping. It also allows quick actuation response as pressurized air supply is available at the port entrance.

ISO 5211

The actuator bottom flange is in accordance with the ISO 5211 international standard and incorporates a star-shaped female drive to flexibly fit a variety of valve output shafts. The valve can be attached by a bracket or mounted directly onto the actuator, using one of the various ISO hole patterns.
